**BUILDING
PROTECTION**

BUILDING PROTECTION PLAN

At McCloud Services we believe that the most responsible and efficient method of pest management is keeping pests out of your facility from the start of service. That's why our integrated pest management programs are based on targeting specific exterior pest risks associated with each time of year. We focus our resources on exact areas of risk, resulting in cost-effective, efficient and environmentally sound pest management.

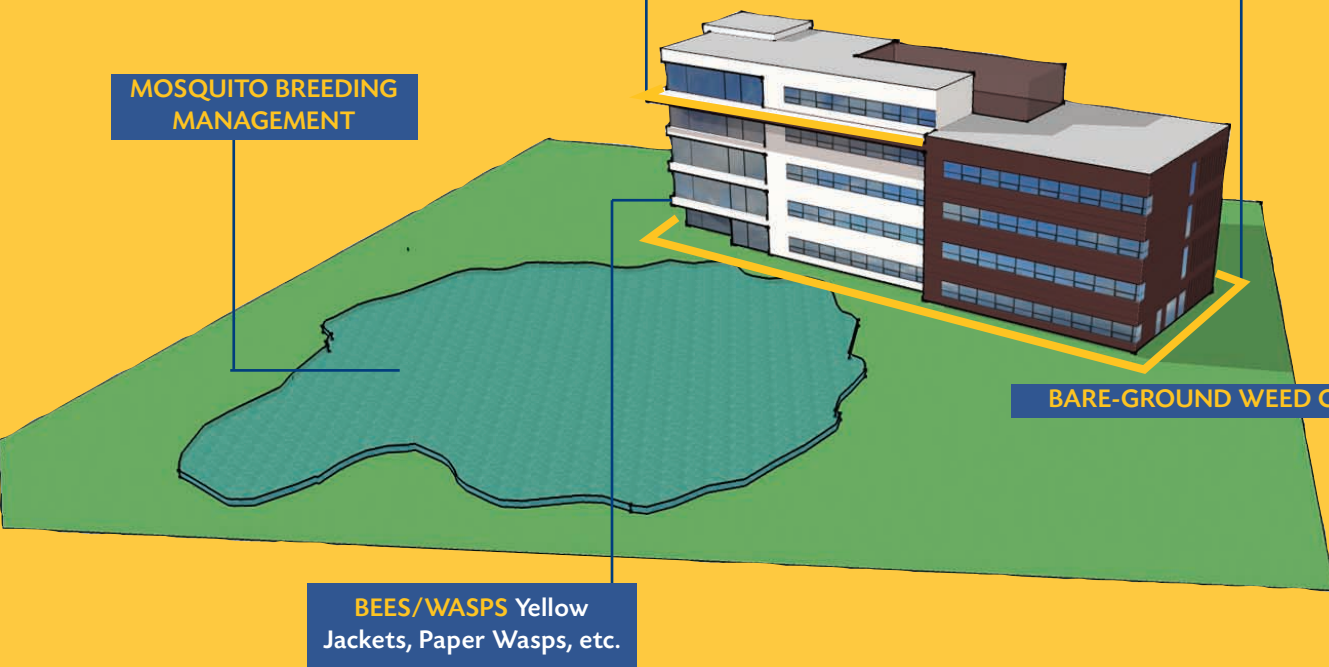

OCCASIONAL INVADER INSECT CONTROL
Spiders, Ladybugs, Ants, etc.

BIRD CONTROL: Pigeons, Sparrows, Starlings, Gulls, etc.

MOSQUITO BREEDING MANAGEMENT

BARE-GROUND WEED CONTROL

BEES/WASPS Yellow Jackets, Paper Wasps, etc.

Mosquito Breeding Management

Mosquito breeding management involves treating all standing bodies of water, as well as pooling water following heavy rainfall, with a larvicide to prevent the emergence of adult mosquitoes. Treatment sites include: lakes, ponds, retention ponds, lowland ditches, catch basins/sewage drains, etc. Treatment is effective for all species of mosquitoes including "Culex Pipiens," the carrier of West Nile Virus.

Bird Management & Exclusion

Effective bird management strategies for even relatively small facilities are often multifaceted and implemented in stages. They must be flexible to accommodate changes in bird behavior and seasonal circumstances.

Occasional Invaders

Occasional invaders are pests that normally live and breed outside of structures but occasionally come indoors. However, general interior conditions do not support the long-term growth and survival of these pests. Depending on the sensitivity of the site, the pest status can range from nuisance pest

to pest of concern. The first line of defense is management on the exterior. Management techniques include the proper use of landscaping materials, moisture management, exclusion, lighting controls and chemical control.

Bee and Wasp

Although beneficial in nature, bees and wasps pose potential problems to people. These insects may be attracted to structures because of food sources created by spills or wastes. They may build nests on or inside structural elements. Sanitation, exclusion, structural modifications, trapping and nest destruction are the typical components of a bee or wasp management program.

Weed Management

Weed management and proper selection of landscaping materials around the facility are important elements of pest prevention. Weeds can provide harborage and food for rodents and insects. Certain types of landscaping materials and vegetation are more conducive to pest development than others. Your McCloud Service Specialist can provide recommendations regarding the elimination of landscaping conditions that are conducive to pests.

COUNT ON US FOR EFFECTIVE **BUILDING** **PROTECTION** PLANS

About us

McCloud Services is truly a client-driven organization. We operate by two fundamental business values:

- Everything we do is aimed at exceeding our customer's expectations – always.
- We are a family owned organization. Rather than focusing on dividends for public stockholders, McCloud Services' interests lie with increasing our client's profitability and reducing risk.

What that means for you and your business is that you can depend on McCloud Services to apply significant resources and innovative methods for managing pests, utilizing a comprehensive program that will result in cost-effective pest management practices to deliver bottom-line results to your company.

Services offered

- Integrated Pest Management (IPM)
- Electronic Data Collection
- Bird Management /Exclusion
- Structural Fumigation
- Container Fumigation
- Fumigation Alternatives
- Organic Compliant Programs
- Vegetation Management
- Sanitation Consultation
- Food Safety Training
- Food Safety Audits
- Bed Bug Management
- LEED Compliant Programs
